

HARDWARE INSTALLATION

The Adaptec AHA-1510 AT-to-SCSI host adapter has been designed to operate as shipped in the majority of AT class computers. The host adapter's factory default jumper settings should remain in their original positions. The AHA-1510 is shipped with the following factory default settings:

*SCSI Disconnection	Enabled
*SCSI Address	7
*SCSI Parity	Disabled
Terminators	Installed
Terminator Power	Supplying
*Synchronous Negot.	Enabled
Interrupt Channel	11
*AT Port Address	340H
*Data Transfer Mode	PIO

*These values are set by the software driver, the ASW-1210 (ASPI2DOS.SYS). The /Z option sets these default values. See SOFTWARE INSTALLATION for more information.

To Perform Installation:

TURN OFF POWER TO THE SYSTEM AND EXTERNAL EQUIPMENT.

Remove the cover of your AT personal computer that exposes the AT bus slots on the motherboard.

Locate an unused AT expansion slot in your AT system. AT type slots can be recognized by the fact that they have 2 physical edge connectors, one 62-pin and the other 36-pin, in line with one another.

Remove the corresponding system expansion slot cover by turning the screw that secures it from the top counterclockwise.

Align the AT I/O Bus Connector on the bottom of the AHA-1510 into this AT slot. Use the screw from the corresponding expansion slot cover to secure the AHA-1510's bracket to your AT system frame.

Attach the SCSI Bus to the host adapter and the peripherals, using either the internal or external connector, making sure that pin 1 orientation is maintained throughout the bus.

The SCSI bus must also be terminated correctly to ensure proper operation. The first and last physical SCSI devices on the SCSI cable must have terminators installed. All other SCSI devices must have terminators removed.

The SCSI factory-installed terminators on the AHA-1510 should be removed if, and only if, you attach SCSI devices to both an internal and external cable, since the internal and external SCSI connectors are the same SCSI bus.

Reassemble your PC system in the reverse order.

Jumper Configuration Reference

One set of jumpers is located on the board to configure user-selectable options. Jumpers installed at the factory are shown as . Those not installed are shown as "8". It should not be necessary to change the jumper settings.

J19 Interrupt Selection

- 12 - Interrupt Request 12 Selection
- 11 - Interrupt Request 11 Selection
- 10 - Interrupt Request 10 Selection
- 19 - Interrupt Request 9 Selection
- AL - PRIMARY/Secondary Port Address Selection

DEFAULT SETTINGS AND REFERENCE DIAGRAM

- Pin pairs 12, 11, 10, and 19 (as marked on your host adapter board) represent your choices for Interrupt Channel Selection. One and only one of these pairs must be selected for proper orientation of the software. The factory default is Interrupt Channel 11 (or 11). Therefore, a jumper is installed at this pin pair. If this hardware jumper setting is changed, the corresponding "/P" option must be set when installing the ASW-1210 (see SOFTWARE INSTALLATION).
- Pin pair AL (marked on your host adapter board) represents your choice for Port Address. The default is no jumper installed and a primary port address of 340H. When you install a jumper at this pin pair, you have selected the alternate port address of 140H. If this hardware jumper setting is changed, the corresponding "/P" option must be set when installing the ASW-1210 (see SOFTWARE INSTALLATION).
