Mellanox Technologies

1 Introduction

Eye Opening is a tool package for:

- Evaluating and testing InfiniBand cables
- For configuring port SerDeses and physical port state (for a single port)
- For finding the optimal configuration for SerDeses of an InfiniBand Tx-Rx pair connected by a cable

The package includes three tools (binary executables) and a GUI which can be used to activate these tools. All tools support IB cable operation at 2.5Gb/s (SDR) or 5Gb/s (DDR).

The three binary executables are:

- **eye_opening_is** - for use with switch systems based on Mellanox's MT47396 InfiniScale III switch device
- **eye_opening_ex** - for use with MT25208 InfiniHost III Ex based HCA cards (Dual 4X IB ports cards)
- **eye_opening_lx** - for use with MT25204 InfiniHost III Lx based HCA cards (Single 4X IB port cards)

The above tools can be run either using the tool's GUI '**eye_gui**' (this is recommended), or from the command line.

Eye Opening enables tuning the *Amplitude* and *Pre-emphasis* levels for the output buffers of Tx SerDeses, and the *Equalization* levels for the input buffers of Rx SerDeses. Tool output is the width of the eye-opening measured in picoseconds (ps) at the Rx-port end. The optimal configuration of SerDeses is that which gives the widest eye-opening possible.

2 Package Contents and Installation

2.1 Package Contents

The `eye_opening-<release>-<system_arch>.tgz` package contains the following:

- `install.sh` - Installation script
- `eye_gui` - GUI tool to run all binaries
- `eye_opening_is` - Eye Opening tool for the MT47396 InfiniScale III based switch systems
- `eye_opening_ex` - Eye Opening tool for the MT25208 InfiniHost III Ex based HCA cards
- `eye_opening_lx` - Eye Opening tool for the MT25204 InfiniHost III Lx based HCA cards
- `uninstall.sh` - Uninstall script
- `BUILD_ID` - Tool revision number

2.2 Hardware Requirements

2.2.1 Test Platform

A PCI or PCI Express host machine with the Linux operating system installed. See *Eye Opening Release Notes* for the list of supported operating systems and kernels.

2.2.2 InfiniBand Related Hardware

Table 1 lists hardware requirements per InfiniBand product type, sorted based on the Mellanox Technologies device used.

Table 1 - Hardware Requirements

InfiniBand Product Type	Mellanox Technologies Device	Required Hardware
Switch System	MT47396 InfiniScale III	<ul style="list-style-type: none"> A USB to I2C Adapter Card (MTUSB-1) - Connects between the USB port of the host machine and the I2C port of the switch system.
		<p><i>OR</i></p> <ul style="list-style-type: none"> A PCI to I2C Adapter Card (Calibre) - Connects to a PCI slot on the host machine at one end and to the I2C port of the switch systems on the other. <p>One 4X or 12X IB cable (depending on port width) to be connected between two ports¹</p>
HCA Card	MT25208 InfiniHost III Ex (Dual 4X IB Port)	One 4X IB cable to be connected between the two IB ports of the HCA ¹
HCA Card	MT25204 InfiniHost III Lx (Single 4X IB Port)	The single IB port needs to be connected in an <i>external</i> self-loop. One possible way is to use an IB Self-loop Connector.

1. The cable is not needed in case the Eye Opening tool is run in the 'set_conf' configuration mode. See [Section 3.2.2, "Configuring Eye Opening GUI," on page 12](#) for details.

2.3 Software Requirements

- MST (Mellanox Software Tools) version 4.2.0 or later must be installed

- Tcl version 8.4 or later must be installed

2.4 Installing Eye Opening

The Eye Opening tool can be obtained from the following sources:

1. It is part of Mellanox's IBGold Distribution (IBGD) software package - see <http://www.mellanox.com>
2. Mellanox's document distribution system (DDS) at <http://docs.mellanox.com> (which requires a customer's login name and password). It is located in the 'Code Releases / Tools' folder under the name eye_opening-<release>-<system_arch>.tgz.

After downloading the appropriate tar file (according to the system architecture: x86 or x86_64), perform the following steps to install the tool:

1. Extract files to a temporary directory using:

```
> tar -zxvf eye_opening-<release>-<system_arch>.tgz
```

This creates a subdirectory called 'eye_opening_install' with Eye Opening installation files.
2. cd to 'eye_opening_install'
3. Run the install script as root:

```
> ./install.sh
```

The installation creates (by default) a /usr/eye_opening directory and copies the packed contents there.
4. (Optional) Delete the temporary installation files and directory (see step 1 above).

3 Using Eye Opening GUI (eye_gui)

This section describes how to configure and start the Eye Opening tool using its GUI. The GUI is an upper level user interface that runs the tool for all the devices.

3.1 Before Running Eye Opening GUI

For Eye Opening tools to operate correctly, the following conditions must be met:

1. The MST driver must be started. Run ‘mst status’ and verify that the relevant Mellanox (switch or HCA) device of the tested hardware is listed.
2. Firmware must be burnt on the device. Moreover, the firmware configuration setting in the .INI file used for firmware burning should have *forced* the IB ports either to SDR operation or to DDR operation, but *not* to auto-negotiation of speed.

Note: If you burnt firmware using a DDR-specific .INI file provided by Mellanox, then the IB ports were set to auto-negotiate IB SDR or DDR operation. This means than firmware must be burnt with a modified .INI file. For details, see the *IB DDR Auto-Negotiation Application Note, Document no. 2162AN*.

Note: If you burnt firmware using an SDR-specific .INI file provided by Mellanox, then the IB ports were forced to operate at SDR. No further action is needed.

3. All HCA device drivers (vapi / gen2 / etc.) must be unloaded.

3.2 Running Eye Opening GUI

3.2.1 Starting Eye Opening GUI

To start using the Eye Opening GUI from the tool directory (by default /usr/eye_opening), enter at the command line:

```
> ./tools/eye_gui &
```

A display window should appear shortly as in [Figure 1, “Eye Opening GUI Display Window”](#). See [Section 3.2.2, “Configuring Eye Opening GUI”](#) for details.

Figure 1: Eye Opening GUI Display Window

The screenshot displays the 'Eye Opening GUI Display Window' with the following sections and controls:

- File Configuration**: A header bar for the configuration section.
- InfiniBand Device:** Three radio buttons: ☐ InfiniHost_III_Lx, ☐ InfiniHost_III_Ex, and ☒ InfiniScale_III.
- Configuration:** A dropdown menu showing 'def_conf'.
- 15 selected configurations with Equalization set to 0.**: A status message.
- Frequency:** Two radio buttons: ☒ 2.5 Gbit/sec and ☐ 5 Gbit/sec.
- Port Width:** Two radio buttons: ☒ 4x and ☐ 12x.
- Select Ports:** A section with a 'Reset Port Selection' button and two rows of port selection buttons.
 - Row 1: ☐ 13, ☐ 14, ☐ 15, ☐ 16, ☐ 17, ☐ 18, ☐ 19, ☐ 20, ☐ 21, ☐ 22, ☐ 23, ☐ 24.
 - Row 2: ☐ 1, ☐ 2, ☐ 3, ☐ 4, ☐ 5, ☐ 6, ☐ 7, ☐ 8, ☐ 9, ☐ 10, ☐ 11, ☐ 12.
- Device:** A dropdown menu.
- Run**: A green button.
- Result:** A text field.
- Best results so far**: A section header.
- Results Area**: A large orange rectangular area for displaying results.

3.2.2 Configuring Eye Opening GUI

The Eye Opening GUI display window (see [Figure 1 on page 11](#)) includes the configuration fields described in the paragraphs to follow. Buttons or selection pull-down menus are available for the various fields.

InfiniBand Device: Select the appropriate Mellanox device for the hardware under configuration/testing.

Configuration: There are four configuration modes in the pull-down menu:

1. 'def_conf' - This is the default configuration mode. 15 pre-selected default configurations are tested on the cable. See [Figure 1, "Eye Opening GUI Display Window," on page 11](#).

In all the configurations, the receiver equalization was set to 0 (no receiver equalization). Furthermore, there is one configuration per *Amplitude* in the range 0 to 15, with the *Pre-Emphasis* parameter chosen so as to obtain optimized performance across all cable lengths range. (The settings are based on Mellanox's experience with cables from different vendors across all lengths up to 30m.)

The 15 selected configurations of (*Amplitude, Pre-Emphasis, Equalization*) - in addition to (0,0,0)- are:

(1,2,0); (2,2,0); (3,4,0); (4,5,0); (5,4,0); (6,5,0); (7,6,0); (8,6,0); (9,6,0); (10,5,0); (11,6,0); (12,5,0); (13,4,0); (14,5,0); (15,7,0)

Note: As no receiver equalization is present in the above configurations, the receiver eye width should be similar to the obtained eye width from external oscilloscope.

Typical execution time in this mode is 2 minutes.

2. 'full configuration scan' - In this mode, all possible SerDes configurations of *Amplitude, Pre-Emphasis, and Equalization* are tested ($16 \times 16 \times 16 = 4096$ configurations). If the cable is tested at 2.5Gb/s, it is possible to set the step resolution in this mode to either 12.5ps (fine) or 6.25ps (very fine). See [Figure 2, "Full Configuration Scan Mode Display - InfiniScale III Case \(4X IB Ports\)," on page 14](#).

The typical execution time with *fine* resolution takes about 6 hours; with *very fine* resolution it takes about 12 hours.

3. 'user defined' - This is a user defined mode. Three bars will appear by which the user can set the desired SerDes *Amplitude, Pre-emphasis, and Equalization*. Each such parameter can be set to a value in the range 0-15.

See [Figure 6, "User Defined Mode Display," on page 16](#).

Execution time in this mode takes a few seconds.

4. 'set_conf' - This mode is used for setting a *single* port configuration and state. Three bars will appear by which the user can set the desired SerDes *Amplitude, Pre-emphasis, and Equalization*. Each such parameter can be set to a value in the range 0-15. Only one port can be selected in this mode.

Below these bars, five state-buttons should be present, by which the user can set a desired physical port state (TX state as described in the *InfiniBand Architecture Specification*). The five optional states are: *Polling, Disabled, TS1, TS2* and *Idle*. See [Figure 7, "set_conf Mode Display," on page 17](#).

Execution time in this mode takes less than a second.

Frequency: The Eye Opening tool supports 2.5Gb/s (SDR) and 5Gb/s (DDR) IB cable operating rates.

Port Width: The tool can test 4X cables or 12X cables. 12X is optional for InfiniScale III testing only. To test 12X, a trio of ports out of the following list must be chosen: {(13,14,15), (16,17,18), (19,20,21), (22,23,24)} (see [Figure 8, "Configuration Example," on page 18](#)).

Select Ports: Select the connected ports out of the displayed list. If a 4X cable is being tested, choose two out of the 4X available ports. If a 12X cable is being tested, choose a pair of trios (see description of 'Port width' above).

Device: The pull-down menu allows to choose between existing *mst* (interface) devices. Through one of these interface devices, Eye Opening commands are passed to the device, using the mst device driver. If the Device tab shows a

blank field, this means that more than one mst device exists and you need to select one of them (click on the arrow to pull down the selection menu).

However, if the Device tab shows 'simulator', this means that no mst device was found. In this case, exit the GUI, reload the mst driver ('mst start'), run 'mst status' to verify than an interface device exists in your system, re-run the Eye Opening GUI (and select the proper mst device one if more than one exists).

3.2.4 Configuration Example

Selecting ‘InfiniScale_III’ for device, ‘2.5Gb/s’ for frequency, ‘def_conf’ for configuration, ‘4X’ for port width, ports ‘1’ and ‘3’, and ‘calibre’ for device will yield the display presented in Figure 8, “Configuration Example”.

Figure 8: Configuration Example

The screenshot shows the 'Configuration' window of the Eye Opening GUI. It has a title bar with 'File' and 'Configuration' menus. The settings are as follows:

- InfiniBand Device:** A dropdown menu with three options: 'InfiniHost_III_Lx' (unchecked), 'InfiniHost_III_Ex' (unchecked), and 'InfiniScale_III' (checked).
- Configuration:** A dropdown menu showing 'def_conf'. Below it, a text label reads '15 selected configurations with Equalization set to 0.'
- Frequency:** Two radio buttons: '2.5 Gbit/sec' (checked) and '5 Gbit/sec' (unchecked).
- Port Width:** Two radio buttons: '4x' (checked) and '12x' (unchecked).
- Select Ports:** A section with a 'Reset Port Selection' button. It contains two rows of checkboxes for ports 13-24 and 1-12. Ports 1, 3, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, and 24 are unchecked. Ports 2 and 4 are checked.
- Device:** A dropdown menu showing 'calibre'.
- Run:** A green button labeled 'Run'.
- Result:** A text field next to the 'Run' button, currently empty.
- Best results so far:** A large, empty orange rectangular area at the bottom of the window.

3.2.5 Running the Eye Opening Test

Once configuration is finished, click on the green <Run> button to start the Eye Opening test.

For the ‘user defined’ mode, the Eye Opening test result will be displayed in the ‘Result’ bar window (see [Figure 9 on page 19](#) for the results of running the example described in Section 3.2.4, “Configuration Example,” on page 18).

For the ‘def_conf’ and ‘full configuration scan’ modes, the test results will be displayed in the ‘Best results so far’ window, where the best 15 results will be displayed sorted from the best of them down to the least good.

Note: For the 'def_conf' and 'full configuration scan' modes it is recommended to define a log file for holding all the execution results prior to the actual test run. It may be useful for post-execution data analysis. See [“GUI Log and Configuration Files” on page 20](#) for log file setup.

3.3 GUI Log and Configuration Files

3.3.1 Log File Setup

In order to record test execution results into a log file, pull down the 'File' menu and select 'Advanced Settings'. See [Figure 10](#).

Figure 10: 'File' Pull-down Menu

An 'Advanced Settings' window will be displayed with a few *optional* items to be set (see [Figure 11](#)). These are described next.

Figure 11: Log File Settings Display

Log File Settings

All the log file settings are optional.

If a name for a log file is given, the test results will be written into that log file.

"Generate Default File Name" will generate a log file name composed of the cable parameters.

Cable Parameters

Cable Vendor:

Length (meters):

Equalized: ☒ yes ☐ no

Signal Detect: ☒ On ☐ Off

Gauge Selection:

Log File Name:

Wait Time (milliseconds):

Error Threshold:

Run Silently: ☒ No ☐ Yes

- **Cable vendor:** Options are: "W.L.Gore", "Amphenol", "Fujikura", "Tyco", "Molex", "Golden Bridge", "Leoni", "EMCore", "FoxConn", and "Other". In addition, the user may add new cable vendors by editing the (tcl) file 'is3_eye_gui.setup' residing in the same directory as the IS3 Eye Opening tool. (Note: Restart the tool after changing this file.)
- **Length:** Enter the cable length in meters
- **Equalized:** Select 'yes' if the cable is equalized, 'no' otherwise
- **Signal Detect:** This is a future feature and currently has no impact.
- **Gauge Selection:** Select the cable gauge. Options are: 22, 23, 24, 25, 26, 28, 30, and 32.

- **Wait Time:** Define the delay in milliseconds between two successive steps. Usually 2ms suffice for testing in stable conditions.
- **Error Threshold:** Define the number of symbol errors allowed in each step (0-255).
- **Run Silently:** For a switch system, this mode enables skipping the i2c-mux setting stage. Note that to run in silent mode, you must first set the i2c-mux after turning on the switch system.

When all these items are set, press 'generate default file name' in order to assign the file name. The file name will appear in the 'Log file name' bar window (see [Figure 11 on page 21](#)).

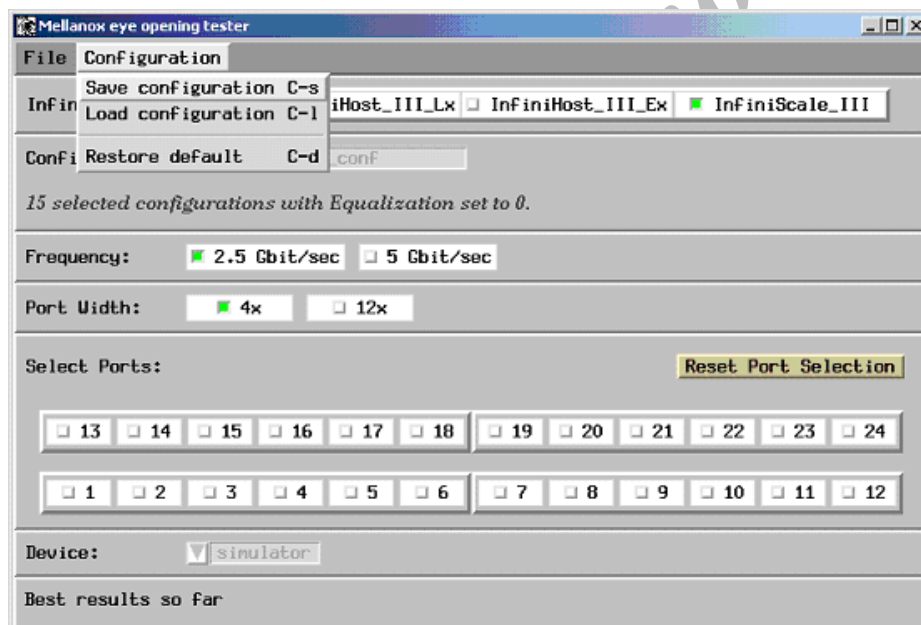

When done, press the 'Hide' button at the bottom of the display to close this window (see [Figure 11 on page 21](#)).

Note: At this stage, it is possible to run the test by clicking on the green button 'Run' on the main display window.

3.3.2 Saving and Loading a Configuration File

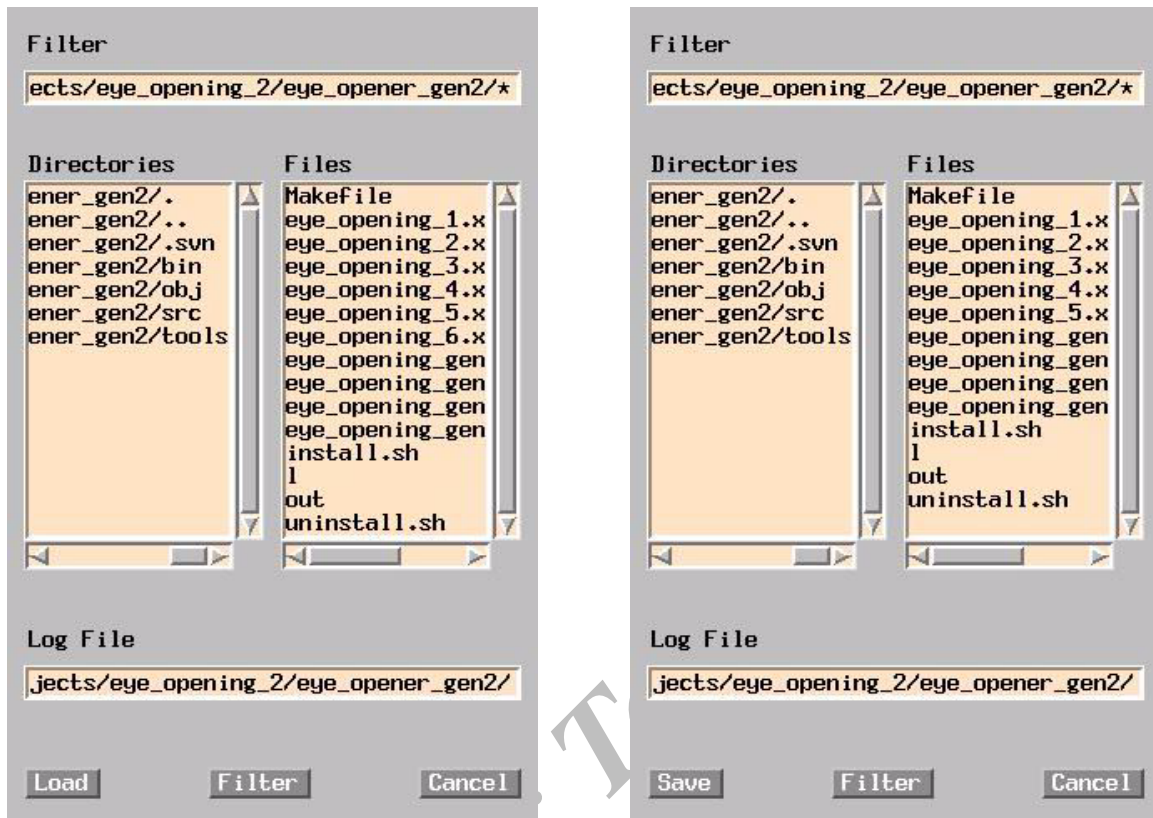

It is possible to save or load a test configuration file (a record of user selections) to/from the disk. These operations are possible using the 'Configuration' pull-down menu. It is also possible to restore the Default Configuration using the same menu. See [Figure 12](#).

Figure 12: 'Configuration' Pull-down Menu

When 'Save configuration' or 'Load configuration' is selected, a 'File Selection' display window pops up for locating the destination/source configuration file. See [Figure 13](#).

Figure 13: Configuration File Selection Filter - Load and Save

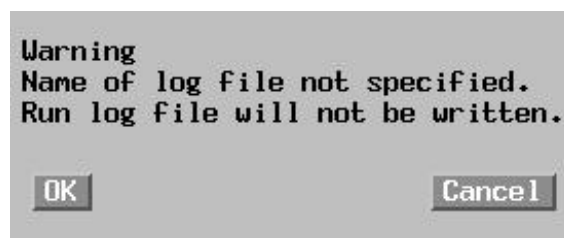

3.4 Troubleshooting Eye Opening GUI

3.4.1 Warning Messages

[Figure 14](#) shows the warning message issued in case a log file name was not specified prior to running eye_gui. It is recommended to click 'Cancel', specify a log file name, then re-run.

Figure 14: Warning Printed by eye_gui

3.4.2 Error Messages

The following error messages are printed by eye_gui:

1. Figure 15 shows the error message in case less than two ports were supplied for the configuration modes: *def_conf*, *full configuration scan*, or *user defined*.

Figure 15: Missing Port(s) for SerDeses' Configuration Scan

2. Figure 16 shows the error message in case a port number was not supplied for the *set_conf* configuration mode.

Figure 16: Missing Port Number for *set_conf* Mode

3. Figure 17 shows the error message in case no mst (interface) device was found. This can occur due to one of the following cases:
 - a. No mst device was selected when more than one exists. This is indicated by an empty field on the 'Device:' tab. To fix this, select the proper device then re-run.
 - b. No mst device was found. The 'Device:' tab indicates 'simulator' in this case. To fix this, exit the GUI, run 'mst start', then 'mst status' to verify an mst device(s) is listed. If so, re-start the Eye Opening GUI.

Figure 17: Missing MST Device Error Message

4 Running from the Command Line

4.1 Before Running Eye Opening

Please see Section 3.1, “Before Running Eye Opening GUI,” on page 10.

4.2 Usage

To run Eye Opening from the command line, change to the `eye_opening` directory and perform the following:

```
> ./bin/eye_opening_xx (xx - [is,lx,ex])
```

The syntax of `eye_opening` is as follows:

```
eye_opening_xx -ports <port1> <port2> [Optional Parameters]
```

where:

-ports <port1> <port2> - Defines the two ports with a cable connecting between them to be tested by **eye_opening**. For InfiniScale III based switch systems, the port numbers should be supplied in the range 1..24. For HCA cards, this flag is optional and the allowed port numbers are 0 and 1 for InfiniHost III Ex based HCA cards. For (single port) InfiniHost III Lx based HCA cards, do *not* specify this option.

and **Optional Parameters** are:

-dev <mst-device-name> - Changes the default device name. The device name is a string by which `eye_opening_xx` identifies your device. For device options, run ‘mst status’
Default: `/dev/mst/mtusb-1`

-set_conf - Configures port SerDeses and port state with the given values in the command. No simulation is run when this flag is supplied (therefore no cable connection is required).

Note: The order of ports specified with the `-ports` option is important: `port1` will be assigned the *Tx Amplitude* and *Pre-Emphasis* parameter settings, and `port2` will be assigned the *Rx Equalization* parameter setting.¹

-port_state <state> - Sets the physical port state. Options are: `0x2 (Polling)`, `0x3 (Disabled)`, `0x8 (TS1)`, `0x9 (TS2)` and `0xA (Idle)`. This options must be used with `-set_conf`.

-serdes_map <0-0xf> - Use this parameter with a number between 0 and 15 to select SerDeses to be tested by **eye_opening**. In the 4-bit binary equivalent, a ‘1’ signifies that a Ser-Des is to be tested.

Examples: ‘`-serdes_map 4`’ (binary 0100) indicates that only SerDes number 2 is to be tested; ‘`-serdes_map 0`’ indicates no SerDes to be tested; and ‘`-serdes_map 15`’ (binary 1111) indicates that all SerDeses are to be tested.

Default: `0xf`

-i2c <i2c_addr> - Defines the virtual i2c address of your device.

1. `eye_gui` operates on a single port only with the `set_conf` configuration option. In effect, `port1` and `port2` there are the same.

- Default: 0x6c for InfiniScale III based systems; 0x48 for InfiniHost III Ex/Lx HCA cards.
- wf <wait factor in msec> - Sets the wait/sleep period in milliseconds between successive steps of eye_opening. While small values make the run faster, big values yield more accurate results.
Default: 10 ms
 - threshold < threshold factor> - Sets the number of symbol errors allowed in each step
Default: 0
 - amp <0-0xf> - Sets the amplitude for all Tx SerDeses of tested ports
Default: No change to current setting
 - pre_emp <0-0xf> - Sets the Pre-Emphasis for all Tx SerDeses of tested ports
Default: No change to current setting
 - eq1 <0-0xf> - Sets the Equalization for all Rx SerDeses of tested ports
Default: No change to current setting
 - step_32 - Instructs eye_opening_xx to perform 32 steps of 400ps instead of 64. Used to save time in testing
Default: Disabled
 - 12x - Tests ports as 12X IB ports. applicable for *eye_opening_is* only.
Default: Disabled
 - silent - Skips the I2C-mux setting stage of a switch system
 - con - Instructs the Eye Opening tool to skip checking for a connected cable
 - h - Displays a short help menu
 - help - Displays this (expanded) help menu
 - usage - Display the command line options (no explanations) with usage examples

4.2.1 Usage Examples

```
./eye_opening_is -ports 1 13
./eye_opening_is -ports 2 24 -wf 15 -amp 0x5 -eq1 0xa -threshold 0xf
./eye_opening_is -ports 1 13 -step_32 -12x
./eye_opening_is -ports 1 13 -amp 2 -pre_emp 3 -eq1 4
```

4.2.2 Run Examples

Example 1:

```
./eye_opening_is -ports 1 13 -amp 2 -pre_emp 3 -eq1 4
```

*** eye_opening_is

*** Running .

Result - IB Port 1 Serdes 0 : 281 ps

Result - IB Port 1 Serdes 1 : 262 ps

Result - IB Port 1 Serdes 2 : 287 ps

Result - IB Port 1 Serdes 3 : 281 ps

Result - IB Port 13 Serdes 0 : 275 ps

Result - IB Port 13 Serdes 1 : 268 ps

Result - IB Port 13 Serdes 2 : 275 ps

Result - IB Port 13 Serdes 3 : 287 ps

Test Result : 262 ps (42)

Note: The number between parentheses on the Test Result line indicates the number of steps. The following equation is true: $\text{steps} * \text{step_resolution} = \text{Test Result (rounded down)}$; thus $42 * 6.25\text{ps} = 262.5\text{ps}$

Example 2:

```
./eye_opening_is -ports 1 13 -dev /dev/mst/calibre -step_32 -wf 2 -threshold 4
-amp 2 -pre_emp 1 -eq1 1
```

```
*****
```

```
***          eye_opening_is
```

```
***      Running .
```

```
Result - IB Port 1          Serdes 0 : 300 ps
```

```
Result - IB Port 1          Serdes 1 : 312 ps
```

```
Result - IB Port 1          Serdes 2 : 300 ps
```

```
Result - IB Port 1          Serdes 3 : 325 ps
```

```
Result - IB Port 13         Serdes 0 : 300 ps
```

```
Result - IB Port 13         Serdes 1 : 312 ps
```

```
Result - IB Port 13         Serdes 2 : 300 ps
```

```
Result - IB Port 13         Serdes 3 : 325 ps
```

```
Test Result      : 300 ps ( 24 )
```

Example 3: (No Eye is Found)

```
./eye_opening_is -ports 1 13 -dev /dev/mst/calibre -step_32 -wf 2 -threshold 4
-amp 14 -pre_emp 9 -eq1 1
```

```
*****
```

```
***          eye_opening_is
```

```
***      Running .
```

```
Result - IB Port 1          Serdes 0 : 275 ps
```

```
Result - IB Port 1          Serdes 1 : 262 ps
```

```
Error :      symbol errors in normal mode
```

```
***      Test Result      - 0
```

5 Evaluating Test Results

Table 2 provides the user with criteria for cable evaluation based on Mellanox's experience running the Eye Opening tool on Mellanox products (HCA cards and IB switches).

Table 2 - Evaluating Cable Performance Based on Eye Opening Width

Eye Opening Width [ps] SerDes @ 5Gb/s	Eye Opening Width [ps] SerDes @ 2.5Gb/s	Cable Evaluation
Above 120	Above 280	Excellent performance (maximum measured is 330ps)
100 - 120	220 - 280	Robust performance
85 - 100	200 - 220	Satisfactory performance
70 - 85	180 - 200	Marginal performance
Below 70	Below 180	Inadequate performance

For the SerDes configuration (1,2,0), typical results observed are summarized in Table 4.

Table 3 - Typical Eye Opening Widths for SerDes Configuration (1,2,0)

Cable Length	Eye Opening Width Observed [ps]
2m	275 to 287
8m	262 to 287
12m	262 to 287
30m	Failure to 250

The best results observed using a Full Configuration scan are summarized in Table 4.

Table 4 - Best Eye Opening Widths Measured for Best Cables

Cable Length	Best Eye Opening Width Observed [ps]
2m	325
12m	312
25m	287
30m	262

Note: The results in Table 4 were obtained using the best cable per length category, and with the SerDeses in optimal configuration.
