## NIOS Architecture

NIOS is the backbone of the NetWare 32-bit client, functioning as the layer which isolates the client core (OS-independent) modules from the platform-specific modules and host operating system.

NIOS also serves as the core module manager, providing all the functionality necessary to load and unload modules as needed.

NIOS provides two major types of APIs: portable and OS-specific. The portable API is available on any NIOS Client-supported platform. Figure 2.1 shows an example of how OS-independent modules of the client use only the portable API. OS-specific modules may use either.

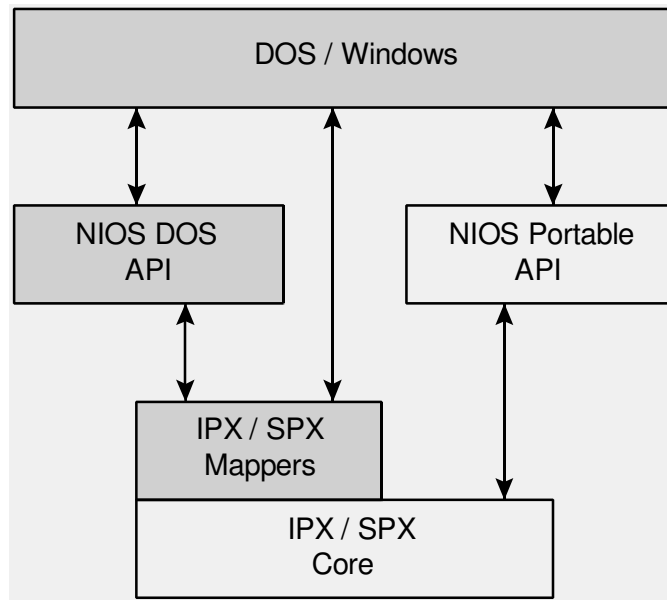

Figure 2.1: Example of NIOS portable and OS-specific APIs; shaded areas identify OS-specific parts.

### Portable NIOS APIs

NIOS provides a robust set of APIs for client modules. These APIs are available on every platform supported by NIOS. Client NLMs that use these APIs exclusively are platform-independent.

Following is a summary of these OS-independent services grouped by functionality for easy reference and overview.

**Note:** If a Client NLM must make use of OS-dependent services, it is best to design source code modules such that OS-dependent and -independent components are easily separated. This is accomplished by designing well- defined and logical interfaces in one's modules so that OS-dependent and -independent components are logically divided in a way that facilitates porting.

Note that all NIOS functions that operate on characters or strings are fully double-byte character aware.

The API calls, described on the pages below, are divided into the following sets of services:

- Configuration Services
- Debug Services
- Event Services
- Handle Management Services
- Hardware Interrupt Services
- Information Services
- Linked List Services
- Module Management Services
- Memory Management Services
- Popup Video Services
- Process Management Services
- Returnable Memory Management Services
- Statistics Services
- Time/Date Services
- User Interface Services
- Utility Services

See Chapter 7 for a detailed description of each API and global variable listed below.

## Global Variables

<b>NiosMemLockFlag</b>	UINT8	Set to non-zero when memory that is going to be accessed at interrupt time must be locked.
<b>NiosSystemFlags</b>	UINT32	Global variable containing various system flags.

## Configuration Services

<b>NiosCfgRead</b>	Gets the value of the first occurrence of the specified keyword.
<b>NiosCfgReadSpecific</b>	Gets the value of the specified occurrence of the specified keyword.
<b>NiosCfgWrite</b>	Writes a keyword and value at the first occurrence of section name.
<b>NiosCfgWriteSpecific</b>	Writes a keyword at the specified occurrence of the section name.
<b>NiosKeywordDeRegister</b>	Deregisters a keyword from the system.
<b>NiosKeywordEnumerate</b>	Retrieves configuration keyword information.
<b>NiosKeywordRegister</b>	Registers a callback invoked when a keyword's value changes.
<b>NiosKeywordResetValue</b>	Resets a keyword value to the default.
<b>NiosKeywordSetValue</b>	Sets a keyword value.
<b>NiosKeywordUpdateNetCfg</b>	Write a keyword value to the configuration file.

## Debug Services

<b>NiosBreak</b>	C macro that executes an INT 1 instruction.
<b>NiosBreak3</b>	Executes an interrupt 03h instruction.
<b>NiosDebugCharInWait</b>	Waits for user input from a debugging console.
<b>NiosDebugCharInNoWait</b>	Tests for user input from a debugger console.
<b>NiosDebugCharOut</b>	Displays a character on a debugger console.
<b>NiosDebugStringOut</b>	Displays a string on a debugger console.
<b>NiosDeregisterDebugger</b>	Deregisters an external debugger.
<b>NiosDprintf</b>	Provides a debug trace-out function.
<b>NiosDprintfDisablePause</b>	Disables pausing while information is output with Printf or Dprintf.
<b>NiosDprintfEnablePause</b>	Enables pausing while information is output with Printf or Dprintf.
<b>NiosDprintfGetPauseMode</b>	Returns the current pause mode setting.
<b>NiosDprintfReset</b>	Determines when the output should be paused. Sets line count to 0.
<b>NiosPrintf</b>	General purpose Printf function.
<b>NiosRegisterDebugger</b>	Registers an external debugger.

## Event Services

<b>NiosCancelForegroundEvent</b>	Cancels a previously scheduled foreground event.
<b>NiosScheduleForegroundEvent</b>	Schedules an event that fires in a foreground context.

## Handle Management Services

<b>NiosAddressToHandle</b>	Returns the handle associated with a 32-bit linear address.
<b>NiosDeregisterHandleClient</b>	Deregisters handle manager client.
<b>NiosFreeHandle</b>	Deallocates a handle fro a given linear address.
<b>NiosGetHandle</b>	Gets a handle for a given linear address.
<b>NiosHandleToAddress</b>	Returns a linear address for a given handle.
<b>NiosListHandles</b>	Enumerates on given client's handles.

**NiosRegisterHandleClient** Registers handle manager client.

## Hardware Interrupt Services

**CheckHardwareInterrupt** Determines if the specified IRQ is requesting service (IRR).  
**DisableHardwareInterrupt** Masks off the specified IRQ.  
**DoEndOfInterrupt** Issues End-Of-Interrupt (EOI) for the specified IRQ.  
**EnableHardwareInterrupt** Masks on the specified IRQ.  
**NiosHookHardwareInt** Installs a handler for the specified IRQ.  
**NiosUnHookHardwareInt** Deinstalls an IRQ handler.

## Information Services

**NiosEnableLogging** Enables and disables logging.  
**NiosGetVersion** Returns the environment type and NIOS version information.  
**NiosGetMemInfo** Returns information about the NIOS memory allocator.

## Linked List Services

**NiosDFindNode** Searches for a given node in a doubly linked queue.  
**NiosDLinkFirst** Inserts a node into the front of a doubly linked queue in LIFO order.  
**NiosDLinkLast** Inserts a node at end of a doubly linked queue.  
**NiosDLinkNext** Inserts a node into a doubly linked queue after a given node.  
**NiosDLinkPrevious** Inserts a node into a doubly linked queue before a given node.  
**NiosDNext** Returns the forward link for a node in a doubly linked list.  
**NiosDNextNode** Returns the forward link for a node in a doubly linked list or zero for no link.  
**NiosDPreviousNode** Returns the backward link for a node in a doubly linked list.  
**NiosDUnlinkFirst** Removes the first node from a doubly linked list.  
**NiosDUnlinkLast** Removes the last node from a doubly linked list.  
**NiosDUnlinkNode** Removes a node from a doubly linked list.  
**NiosDQueueInit** Initializes a doubly linked queue.  
**NiosFindNode** Tests if queue entry key is a member of a specified queue.  
**NiosLinkFirst** Inserts a node into the front of a singly linked list.  
**NiosLinkLast** Inserts a node at the end of a singly linked list.  
**NiosLinkNext** Inserts a node after the specified node in a singly linked list.  
**NiosNextNode** Takes a queue entry and returns the next entry in the queue.  
**NiosUnlinkFirst** Unlinks the first queue entry from a singly linked queue.  
**NiosUnlinkNext** Removes a node into the front of a singly linked list.  
**NiosUnlinkNode** Unlinks a specified node from the queue.

## Module Management Services

<b>NiosCreateModuleHandle</b>	Gets a NIOS-environment module handle for a non-NLM module.
<b>NiosDeportNlmApi</b>	Deletes an anonymous reference to the specified NLM API function.
<b>NiosDestroyModuleHandle</b>	Destroys a module handle created by NiosCreateModuleHandle.
<b>NiosEnumLoadedModules</b>	Enumerates the currently loaded modules.
<b>NiosGetAddressOwner</b>	Determines which NLM owns the specified memory.
<b>NiosGetModHandleFromName</b>	Locates the module handle for the specified named module.
<b>NiosHookExportedApi</b>	Installs a different handler for a given exported API.
<b>NiosImportNlmApi</b>	Determines the linear address of the specified NLM API name.
<b>NiosLoadModule</b>	Loads and installs an NLM.
<b>NiosUnHookExportedApi</b>	Deinstalls a previously hooked exported API.
<b>NiosUnloadModule</b>	Unloads an NLM from the system.
<b>NiosUnloadSelf</b>	Allows an NLM to unload itself.
<b>NiosValidateModuleHandle</b>	Determines if an NLM module handle is valid.

## Memory Management Services

<b>NiosFree</b>	Deallocates a previously allocated memory block.
<b>NiosGetMemInfo</b>	Returns information about the NIOS memory allocator.
<b>NiosGetPhysLinearStart</b>	Returns a linear range that maps the entire physical address range.
<b>NiosIsPhysContig</b>	Determines if the specified linear range is physically contiguous.
<b>NiosLinToPhys</b>	Returns the physical address of a specified linear address.
<b>NiosLongTermAlloc</b>	Allocates a memory block for long-term usage.
<b>NiosMapPhysMemory</b>	Allocates a linear address range for a non-system physical range.
<b>NiosPageLock</b>	Locks the specified memory region, keeping it present and fixed.
<b>NiosPageUnlock</b>	Unlocks the specified memory region so that it can be demand-paged.
<b>NiosPhysContigAlloc</b>	Allocates a physically contiguous memory block.
<b>NiosShortTermAlloc</b>	Allocates a memory block for short-term usage.

## Popup Video Services

<b>NiosVidCreateDialogBox</b>	Creates a modeless dialog box (status box).
<b>NiosVidDestroyDialogBox</b>	Destroys the previously created dialog box referenced by the handle parameter.
<b>NiosVidInputDialogBox</b>	Displays an input dialog and handles the user input.
<b>NiosVidMessageBox</b>	Displays a message box and handles the user input.
<b>NiosVidUpdateDialogBox</b>	Updates the title and the prompt of the status dialog.

## Process Management Services

<b>NiosCreateSemaphore</b>	Allocates a new semaphore.
<b>NiosDestroySemaphore</b>	Destroys a previously allocated semaphore.
<b>NiosExamineSemaphore</b>	Examines the current token count of the specified semaphore.
<b>NiosGetCurrProcessGroupId</b>	Returns the ID assigned to the currently executing process group.
<b>NiosGetCurrProcessId</b>	Returns the ID assigned to the currently executing process.
<b>NiosGetProcessName</b>	Returns a displayable description of the specified process.
<b>NiosPoll</b>	Yields to other waiting processes.
<b>NiosSignalSemaphore</b>	Performs an "up" operation on a semaphore.
<b>NiosThreadArmId</b>	Initializes for a subsequent call to <b>NiosThreadBlockOnId</b> .
<b>NiosThreadBlockOnId</b>	Blocks currently running thread of execution until specified id is signaled.
<b>NiosThreadSignalId</b>	Unblocks the thread currently blocked on the specified id.
<b>NiosWaitSemaphore</b>	Performs a "down" operation on a semaphore.

## Returnable Memory Management Services

<b>NiosMemPoolCheckAvail</b>	Returns number of blocks in memory pool which are not allocated.
<b>NiosMemPoolDeRegister</b>	Deregisters a module with the memory pool manager.
<b>NiosMemPoolEnum</b>	Enumerates all memory blocks held by an application.
<b>NiosMemPoolFindBlock</b>	Look-up or allocate a block of memory.
<b>NiosMemPoolFreeBlock</b>	Releases a memory block.
<b>NiosMemPoolGetSize</b>	Determines how many blocks are available to the system or the application.
<b>NiosMemPoolGetVersion</b>	Retrieves version and memory option information.
<b>NiosMemPoolHold</b>	Increments the hold count on a memory block.
<b>NiosMemPoolMakeMRU</b>	Same as FindBlock function with MP_MAKE_MRU option.
<b>NiosMemPoolRegister</b>	Registers a module with the memory pool manager.
<b>NiosMemPoolTestHold</b>	Returns the number of holds placed on a memory block.
<b>NiosMemPoolUnhold</b>	Decrements the hold count on a memory block.

## Statistics Services

<b>NiosStatDeRegister</b>	Removes an entry from the registry.
<b>NiosStatEnumerate</b>	Enumerates through available statistics tables.
<b>NiosStatGetTable</b>	Retrieves specific statistics table in condensed form.
<b>NiosStatRegister</b>	Creates an entry in the statistics registry.
<b>NiosStatResetTable</b>	Sets all UIN T32 and UIN T64 counters to zero for the requested table.

## Time/Date Services

<b>NiosGetDateTime</b>	Returns the current date and time.
<b>NiosSetDateTime</b>	Sets the system date and time.

## Timer Services

<b>NiosCancelAESEvent</b>	Cancels the specified outstanding AES event.
<b>NiosCancelAllModuleAESEvents</b>	Cancels all outstanding AES events for the specified module.
<b>NiosGetHighResIntervalMarker</b>	Returns a high resolution timer marker accurate to 1 microsecond.
<b>NiosGetIntervalMarker</b>	Returns a timer marker accurate to 55ms. Units are in milliseconds.
<b>NiosGetTickCount</b>	Returns a timer marker accurate to 55ms. Units are in 1/18 s.
<b>NiosScheduleAESEvent</b>	Schedules an event to fire after a specified amount of time.

## User Interface Services

<b>NiosDeregisterStdOutHandler</b>	Deregisters a StdOut handler.
<b>NiosPrintf</b>	Formats and displays strings.
<b>NiosRegisterStdOutHandler</b>	Registers a handler to receive StdOut message notifications.

## Utility Services

<b>NiosChar</b>	Returns the size of a character.
<b>NiosCli</b>	C macro that clears the interrupt flag.
<b>NiosEatWhite</b>	Removes leading white space from a string.
<b>NiosHexCharToByte</b>	Converts hex alpha numeric character into a byte.
<b>NiosMemCmp</b>	Case-sensitive memory compare.
<b>NiosMemCmpi</b>	Case-insensitive memory compare.
<b>NiosMemCpy</b>	Copies the contents of one memory buffer to another.
<b>NiosMemSet</b>	Initializes a memory buffer to a given value.
<b>NiosNextChar</b>	Advances a string pointer by one character.
<b>NiosPopfd</b>	C macro restores the Eflags register to specified value.
<b>NiosPrevChar</b>	Backs up a string pointer by one character.
<b>NiosPrintf</b>	A double-byte-character-aware printf function.
<b>NiosPushfd</b>	C macro that returns the current value of the Eflags register.
<b>NiosPushfdCli</b>	C macro that returns the current Eflags register.
<b>NiosSprintf</b>	String formatting service.
<b>NiosSti</b>	C macro that sets the interrupt flag.
<b>NiosStrChr</b>	Searches a string for a given character.
<b>NiosStrCmp</b>	Case-sensitive string compare.
<b>NiosStrCmpi</b>	Case-insensitive string compare.
<b>NiosStrCpy</b>	Copies the contents of one string to another.
<b>NiosStrLwr</b>	Converts all uppercase characters in a specified string to lowercase.
<b>NiosStrtoByteArray</b>	Converts ASCIIZ numeric string into a byte array.
<b>NiosStrtoul</b>	Converts a string to a value in the given radix.
<b>NiosStrUpr</b>	Converts all lowercase characters in a specified string to uppercase.
<b>NiosTestCharBoundary</b>	Determines if a string pointer bisects a double-byte character.

**NiosToLower**  
**NiosToUpper**  
**NiosUltoa**

Converts an uppercase character to lowercase.

Converts a lowercase character to uppercase.

Converts a value to a displayable string in the given radix.

## **Vxd Access Services**

<b>NiosVxdBeginNlmUse</b>	Determines if the specified NLM is present and builds a Vxd/NLM dependency.
<b>NiosVxdEndNlmUse</b>	Destroys the Vxd/NLM dependency allowing the NLM to be unloaded.
<b>NiosVxdGetVersion</b>	Returns NIOS version information and signals initialization complete.

## Supported NetWare OS API Calls

The following list of NetWare OS API function calls are supported by the 32-bit client architecture:

**Note:** Entries preceded by "&" are data variables.

&IOConfigurationList  
AddPollingProcedureRtag  
Alloc  
AllocateResourceTag  
CancelInterruptTimeCallBack  
CancelNoSleepAESProcessEvent  
CancelSleepAESProcessEvent  
CFindResourceTag  
CheckHardwareInterrupt  
ClearHardwareInterrupt  
CloseFile  
CPSemaphore  
CRescheduleLast  
CVSemaphore  
DeRegisterHardwareOptions  
DisableHardwareInterrupt  
DoEndOfInterrupt  
DoRealModeInterrupt  
EnableHardwareInterrupt  
Free  
GetCurrentTime  
GetDebuggerActiveCount  
GetFileServerMajorVersionNumber  
GetFileServerMinorVerionsNumber  
GetFileSize  
GetHardwareBusType  
GetNestedInterruptLevel  
GetNLMNames  
GetNLMVersionInfo  
GetProcessorSpeedRating  
GetRealModeWorkSpace  
GetServerConfigurationType  
GetServerPhysicalOffset  
GetSuperHighResolutionTimer  
GetSystemMemoryMap  
ImportPublicSymbol  
INWDOSClose

---

INWDOSLSeek  
KillMe  
OpenFileUsingSearchPath  
OutputToScreen  
ParseDriverParameters  
ReadEISAConfig  
RegisterForEventNotification  
RegisterHardwareOptions  
RemovePollingProcedure  
ReturnMessageInformation  
ScheduleInterruptTimeCallBack  
ScheduleNoSleepAESProcessEvent  
ScheduleSleepAESProcessEvent  
SetHardwareInterrupt  
UnImportPublicSymbol  
UnRegisterEventNotification

### **NetWare 3.11 Only Publics**

AllocBufferBelow16Meg  
AllocSemiPermMemory  
FreeBufferBelow16Meg  
FreeSemiPermMemory  
MapAbsoluteAddressToDataOffset  
MapDataOffsetToAbsoluteAddress  
MapCodeOffsetToAbsoluteAddress  
QueueSystemAlert

### **Supported NSI/NBI Calls**

CDoBusEndOfInterrupt  
ClearBusInterrupt  
DMACleanup  
DMAStart  
DMAStatus  
FreeBusMemory  
GetAlignment  
GetBusInfo  
GetBusName  
GetBusTag  
GetBusType  
GetCardConfigInfo

Wrt64

## Overviews of Selected Services

Some of the chapters in this document focus on specific sets of services, such as Chapter 4 “Memory Pool Services” and Chapter 5 “Popup Video Services”, because these services require extensive explanation. Other services need very little explanation.

In this section, the focus is on two sets of services which need only a brief overview: Queue Management Services and Handle Management Services.

### Queue Management Services Overview

NIOS provides a set of linked list management routines that supports both singly and doubly linked lists that are linear (non-circular). Routines are provided for inserting elements at the start and end of a specified queue. There are also routines that provide standard insert, traverse and removal operations within a list.

A set of helper macros are provided in the include file NIOSQ.H that support standard link list operations via macros to minimize latency in making a direct call to perform these operations.

Queue nodes must have a forward link for singly linked lists and forward and backward links for doubly link lists. The offsets to these fields must be provided when using a queueing call. A queueing structure is required to maintain the queue pointers (first and last node) of the list that is requiring the link list operation.

Use of these functions in time critical code is not suggested.

### Handle Manager Services Overview

The handle manager provides a mechanism for providing handle dereferencing of linear address space. These API are useful when a service provider needs to supply information to a client, but does not (or cannot) supply the true linear address of the information.

The handle manager supplies routines for:

- Allocating handles
- Freeing handles
- Listing handles associated with a given service provider
- Finding the linear address associated with a given handle
- Finding a handle associated with a given linear address

To utilize the handle manager the service provider (client of the handle manager) must register for the service and when the service is no longer required a de-registration mechanism is provided.

The following 7 APIs which are used to read and write to a configuration file:

NiosRegisterHandleClient  
NiosDeregisterHandleClient  
NiosGetHandle  
NiosFreeHandle  
NiosListHandles  
NiosHandleToAddress  
NiosAddressToHandle
